

Implementing General Purpose Applications with the Rule-based Approach

Igor Wojnicki, PhD
wojnicki@agh.edu.pl

AGH University of Science and Technology, Cracow, Poland

RuleML 2011, Barcelona, Spain

Why?

- Formal analysis.
- Verification.
- More natural/intuitive approach (Human Mind Model).
- Faster, more reliable transition from *requirements* to *design* to *implementation* (Software Engineering).

What do I need?

- Interactivity.
- Communication with the environment.
- Application Logic and Presentation separation ← MVC.

Four Layer Architecture

Four Layer Architecture

Inference Engine.

Knowledge Base (Application Logic).

Environment Knowledge Base.

Environment Routines.

Inference Engine

- Beating HeaRT.
- Knowledge representation: rules grouped by contexts.
 - Extended Tabular Trees – XTT².
 - XML encoded.
- Inference: Forward Chaining with Context Switching.
- Implemented in Prolog (SWI Prolog).
- Java language integration.

Knowledge representation and visualization: XTT²

Environment Knowledge Base

Input Output Declarations

- Well defined *domains* and *class* for each attribute: *state*, *ro*, *wo*, *rw*.
- IOD with Prolog triggers:

```
io(att_12,ro_trigger,get_character).
```

```
io(att_10,wo_trigger,write_chars_to_file).
```

- IOD with Java triggers.

```
io(att_12,ro_trigger,['EditorWindow',get_character,  
editor]).
```

```
io(att_3,wo_trigger,['EditorWindow',display_chars,  
editor]).
```

Beating HeaRT Architecture

Simple Text Editor

cursor	chars	cursor	chars	
		= [0]	= []	ruL_0

xtt_0: init

inkey	key	
in [left,right,backspace]	= inkey	ruL_1
eq [^o]	= inkey	ruL_2
eq [^s]	= inkey	ruL_3
eq [^q]		ruL_4
notin [left,right,backspace,^o,^s,^q]	= inkey	ruL_5

xtt_1: incoming data processing

key	cursor	
eq [left]	= sub(cursor,[1])	ruL_6
eq [right]	= add(cursor,[1])	ruL_7
eq [backspace]	= sub(cursor,[1])	ruL_8
notin [left,right,backspace,^o]	= add(cursor,[1])	ruL_15
eq [^o]	= [0]	ruL_16

xtt_2: cursor management

file reading

file saving

cursor	key	ichar	chars	
	eq [^o]		= ichar	ruL_9
	eq [backspace]		= remove(chars,cursor)	ruL_10
	notin [backspace,^o]		= insert(chars,cursor,key)	ruL_11

xtt_5: buffer management

Environment Knowledge Base (IOD): Prolog

```
% inkey attribute
io(att_12,ro_trigger,get_character).
% inchar attribute
io(att_8,ro_trigger,read_chars_from_file).
% outchar attribute
io(att_10,wo_trigger,write_chars_to_file).
% chars attribute
io(att_3,wo_trigger,display_chars).
% cursor attribute
io(att_4,wo_trigger,display_cursor).
```

Running...

```
wojnicki@rabbit: /home/wojnicki/work/bheart

```

Environment Knowledge Base (IOD): Java

```
% inkey attribute
io(att_12,ro_trigger,['EditorWindow',get_character,editor]).

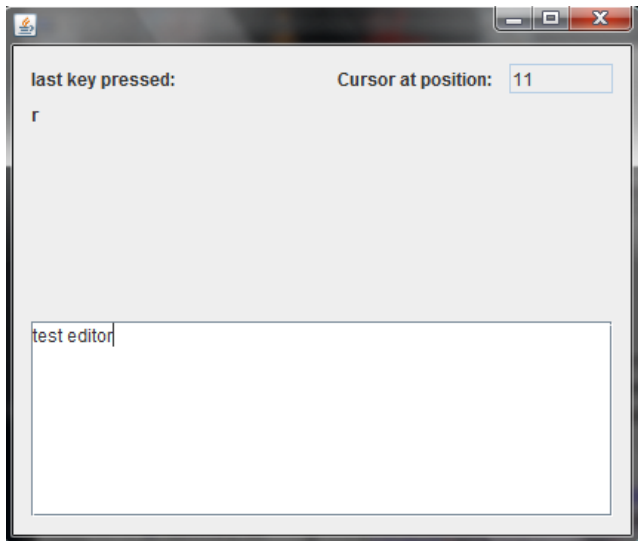

% inchar
io(att_8,ro_trigger,['EditorWindow',read_chars_from_file,
                    editor]).

% outchar attribute
io(att_10,wo_trigger,['EditorWindow',write_chars_to_file,
                    editor]).

% chars attribute
io(att_3,wo_trigger,['EditorWindow',display_chars,editor]).

% cursor attribute
io(att_4,wo_trigger,['EditorWindow',display_cursor,editor]).
```

Running...

Summary

FLA Approach:

- Inference Engine (Beating HearT).
- Knowledge Base (XTT²).
- Environment Knowledge Base (IOD).
- Environment Routines (Triggers).

Outcome

Implementing rule-based general purpose, interactive applications.

Future Work

- Context-based Reasoning integration (CxBR).
- Tools, tools, tools.
- Cases: case modeling and implementation.
- Trigger library.
- Parallel rule firing.
- RIF/RuleML interoperability.
- Ontology integration.
